# MOEJ-IIASA, Project B

- Achieving both the 2030 Agenda and the Paris Agreement requires effective measures that maximize synergies of policies to limit climate change with the SDGs.
- *Project B of MOEJ-IIASA collaboration focuses on two critical linkages:*

Phase 1: Health co-benefits of national climate policies

Phase 2.1: Interactions between climate policies and biodiversity

Phase 2.2: Energy-food-water and health nexus in Bhutan

Phase 2.3: National dashboard for Asia (multi-sector vulnerability & exposure)

# Air quality and health co-benefits of climate policies

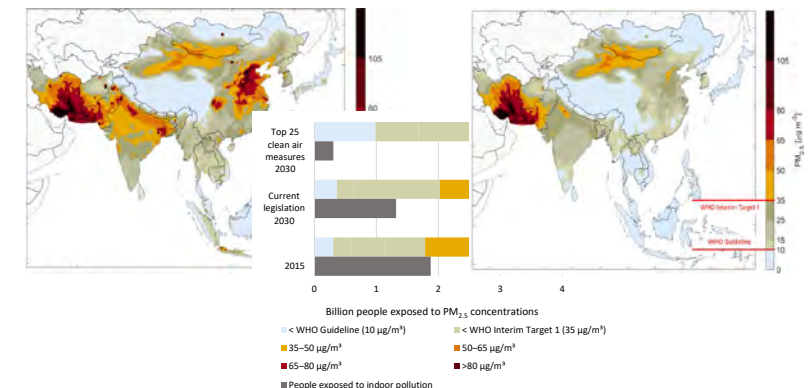

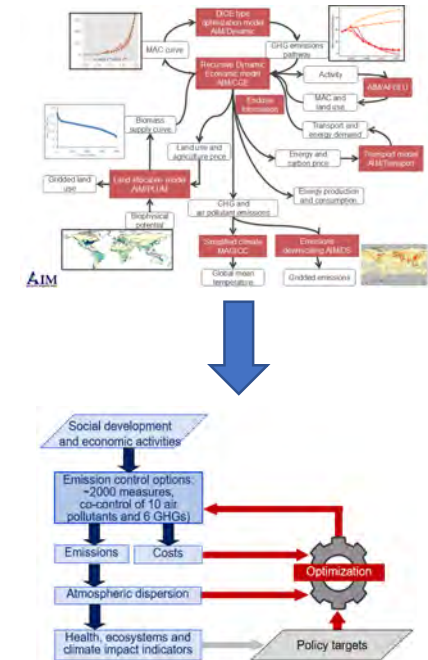

Gregor Kiesewetter<sup>1</sup>, Zbigniew Klimont<sup>1</sup>, Shinichiro Fujimori<sup>2</sup>

<sup>1</sup> *Pollution Management Research Group, Energy, Climate and Environment program, IIASA, Austria*

<sup>2</sup> *Kyoto University and NIES, Japan*

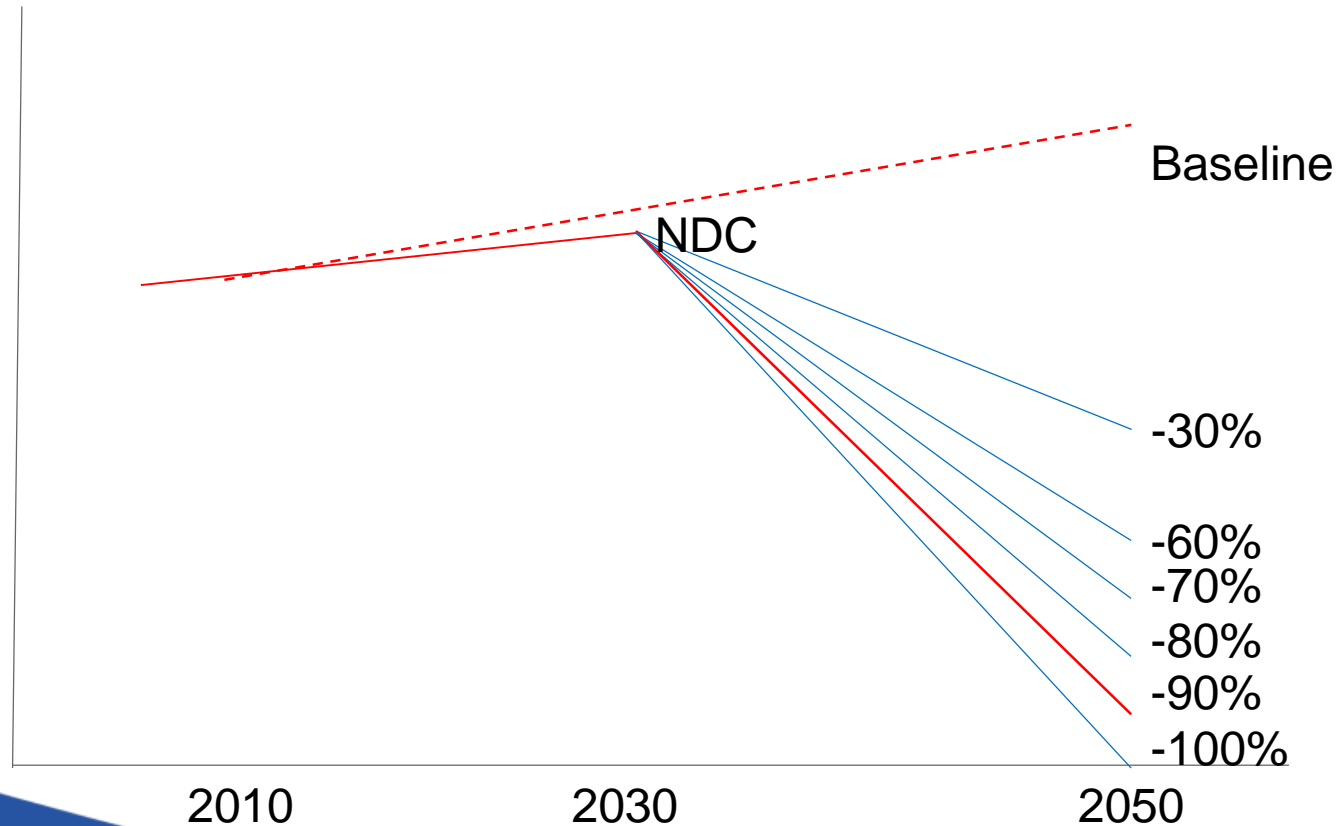

# Tools and approach

- **AIM** – National decarbonization and climate policy scenarios
- **GAINS** - Air pollution and health benefits
- Build a link between AIM and GAINS to downscale AIM scenarios to be used in GAINS for co-benefit and impact assessment
- Calculate and analyze PM<sub>2.5</sub> concentrations, exposure, and health impact indicators at a national/regional scale

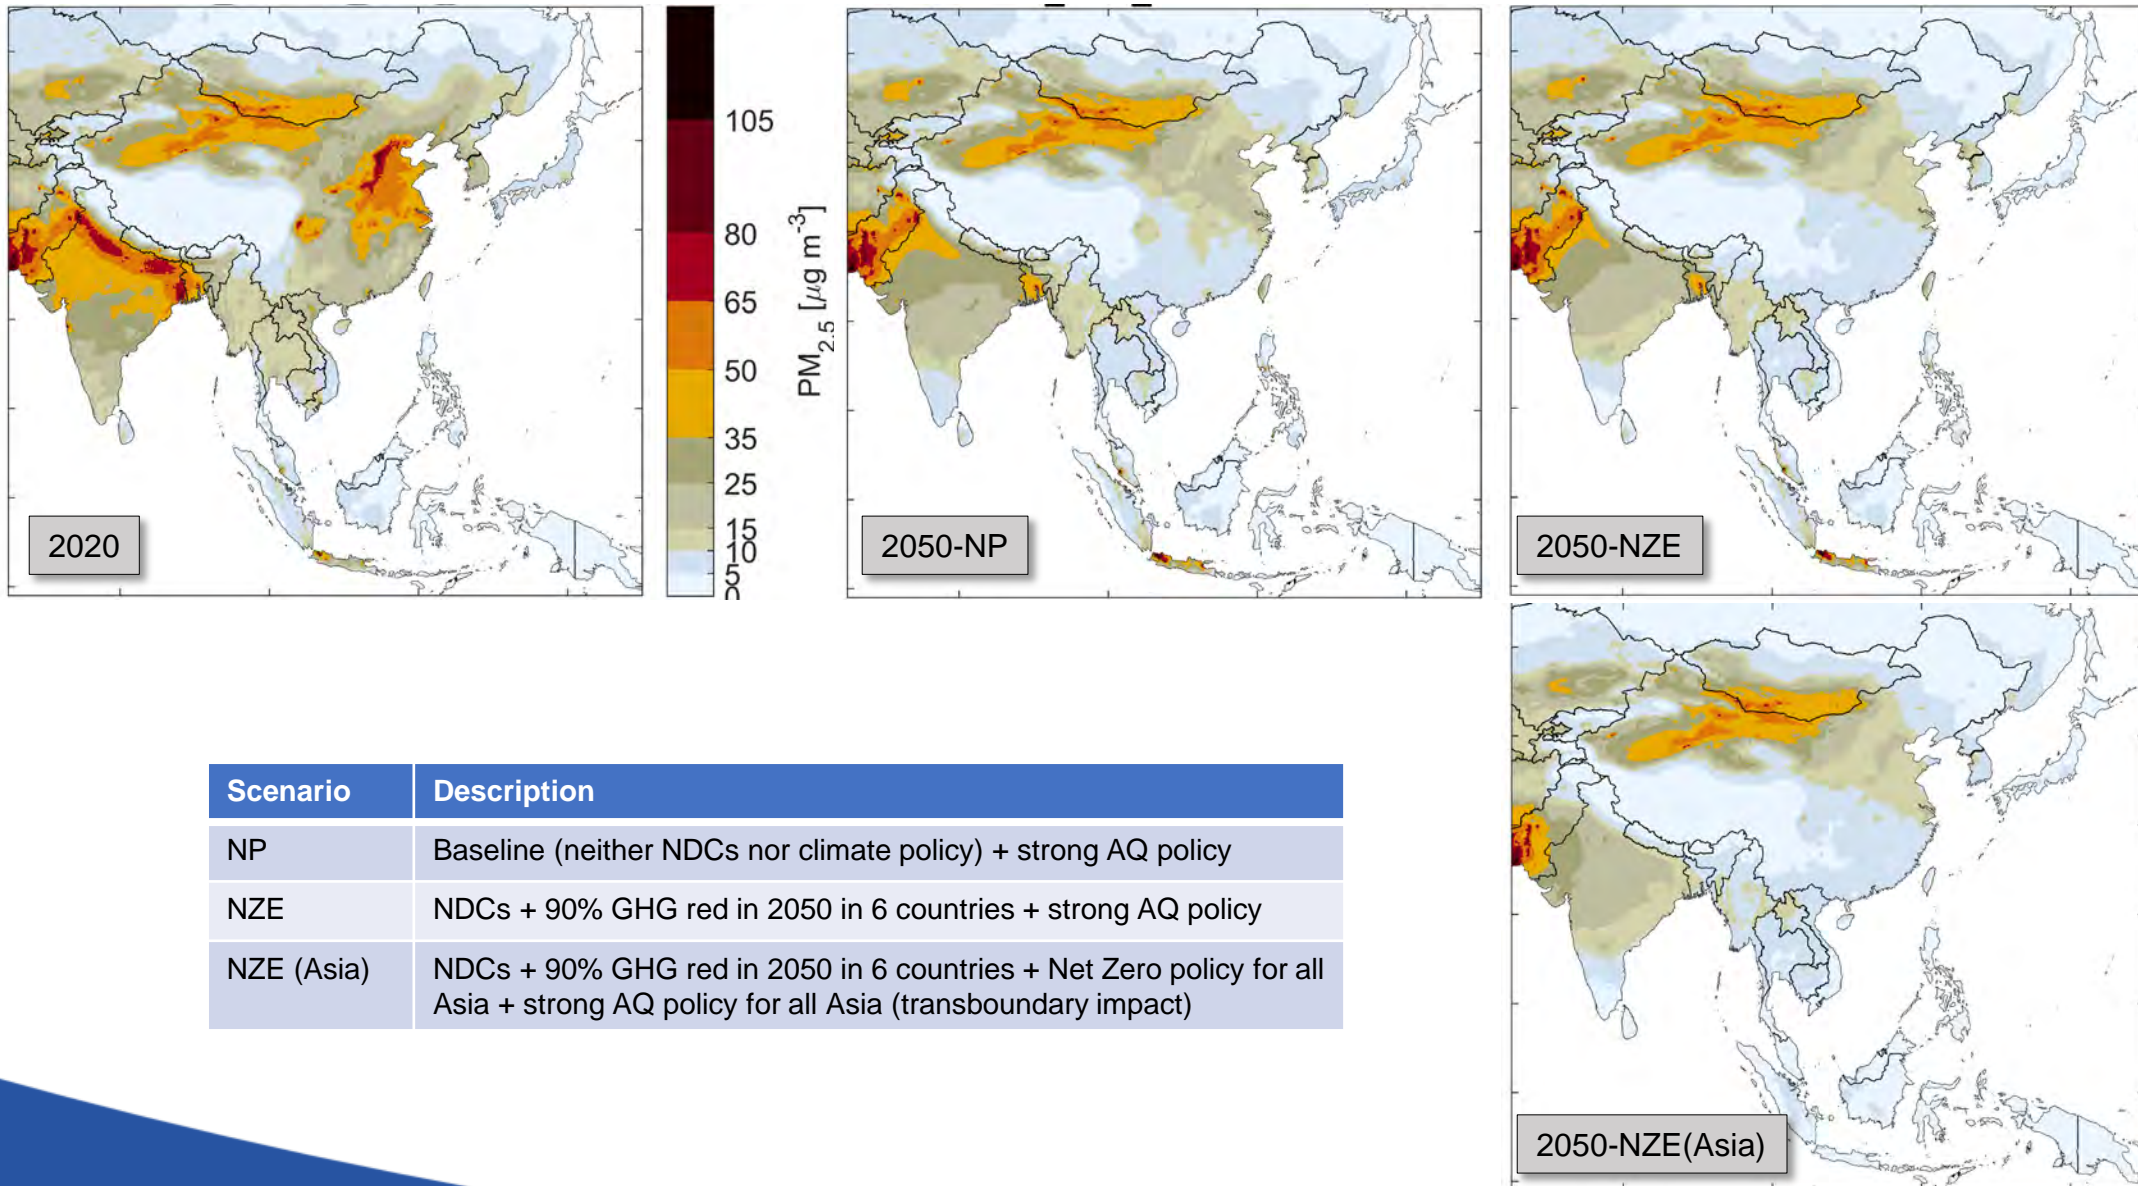

- Baseline: similar to SSP2-4.5
- Policy cases: NDC in 2030, and 0-100% reduction in 2050, relative to the 2010 level of National inventory.
- For all scenarios either current or strong air quality policy assumed (*strong policy examples in today's presentation*)

Scenario	Description
NP	Baseline (neither NDCs nor climate policy) + strong AQ policy (only 6 countries)
NZE	NDCs (6 countries) + 90% GHG reduction in 2050 (6 countries) + strong AQ policy (6 countries)
NZE (Asia)	NDCs (6 countries) + 90% GHG reduction in 2050 (6 countries) + Net Zero policy for all Asia + strong AQ policy for all Asia (transboundary impact)

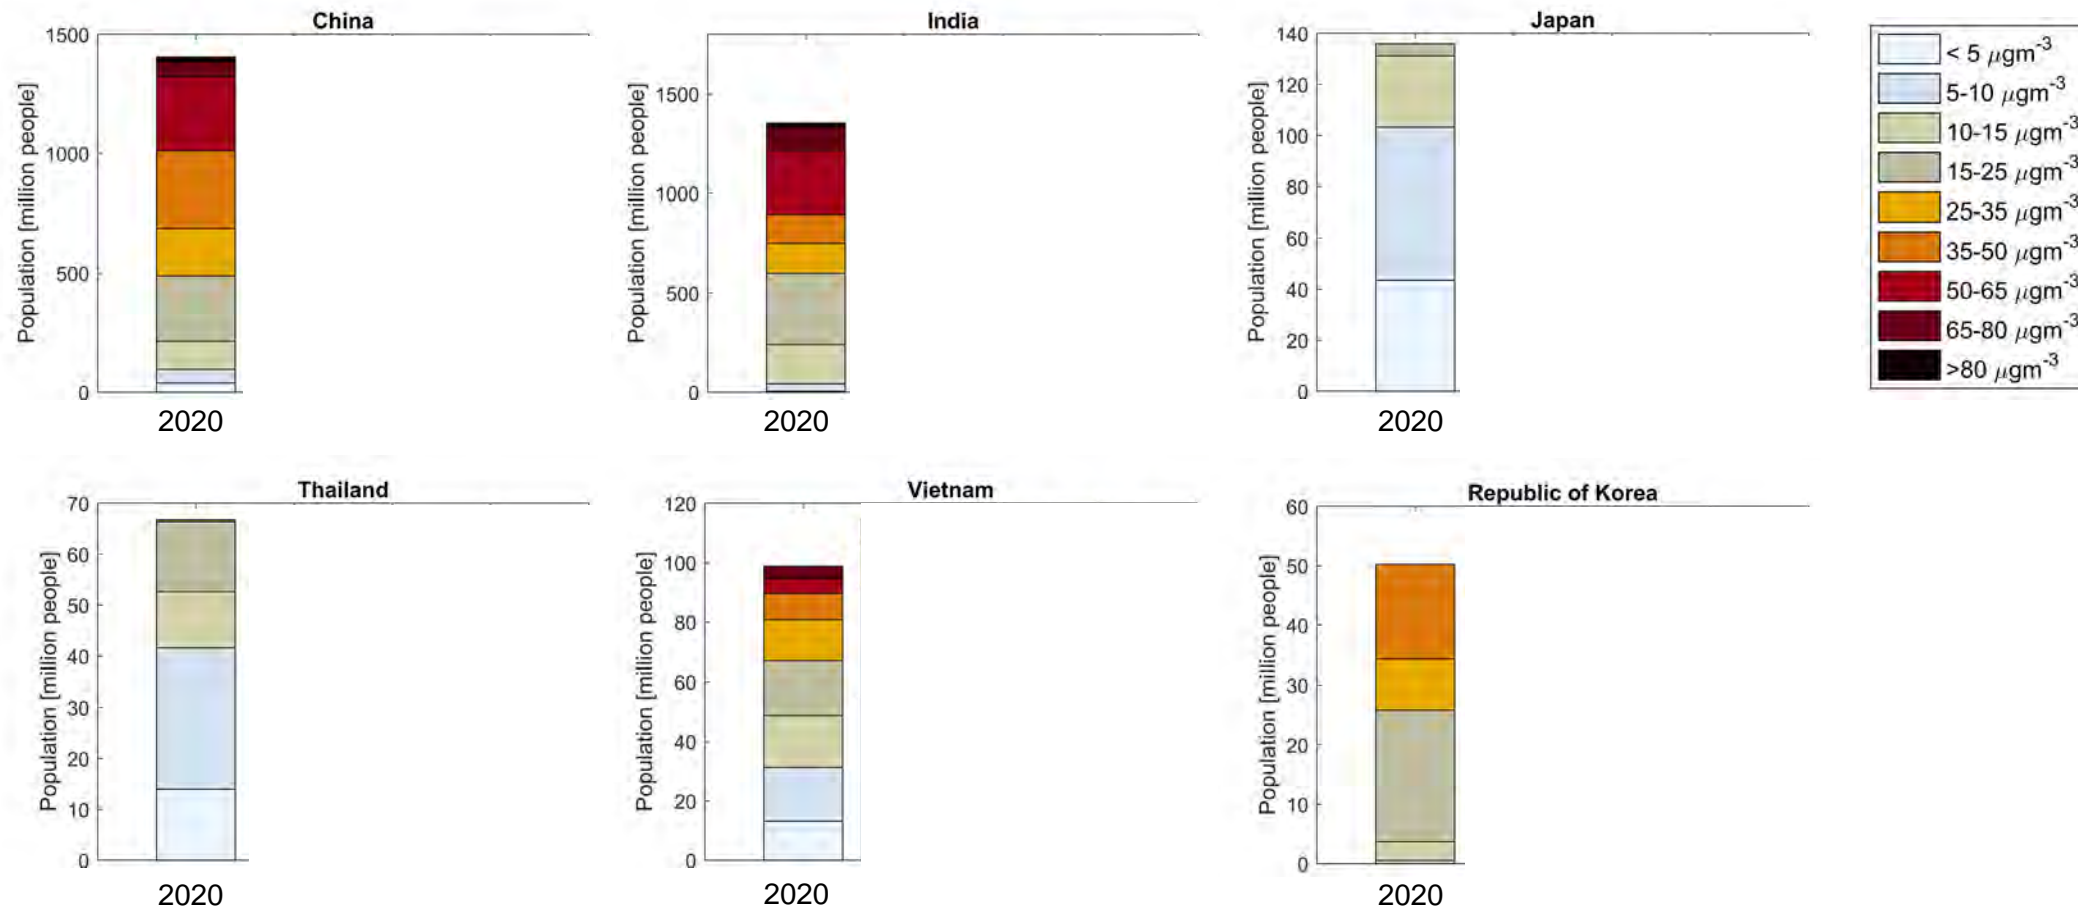

# Illustrative results:

## *Change in annual mean PM<sub>2.5</sub> concentrations*

# Illustrative results:

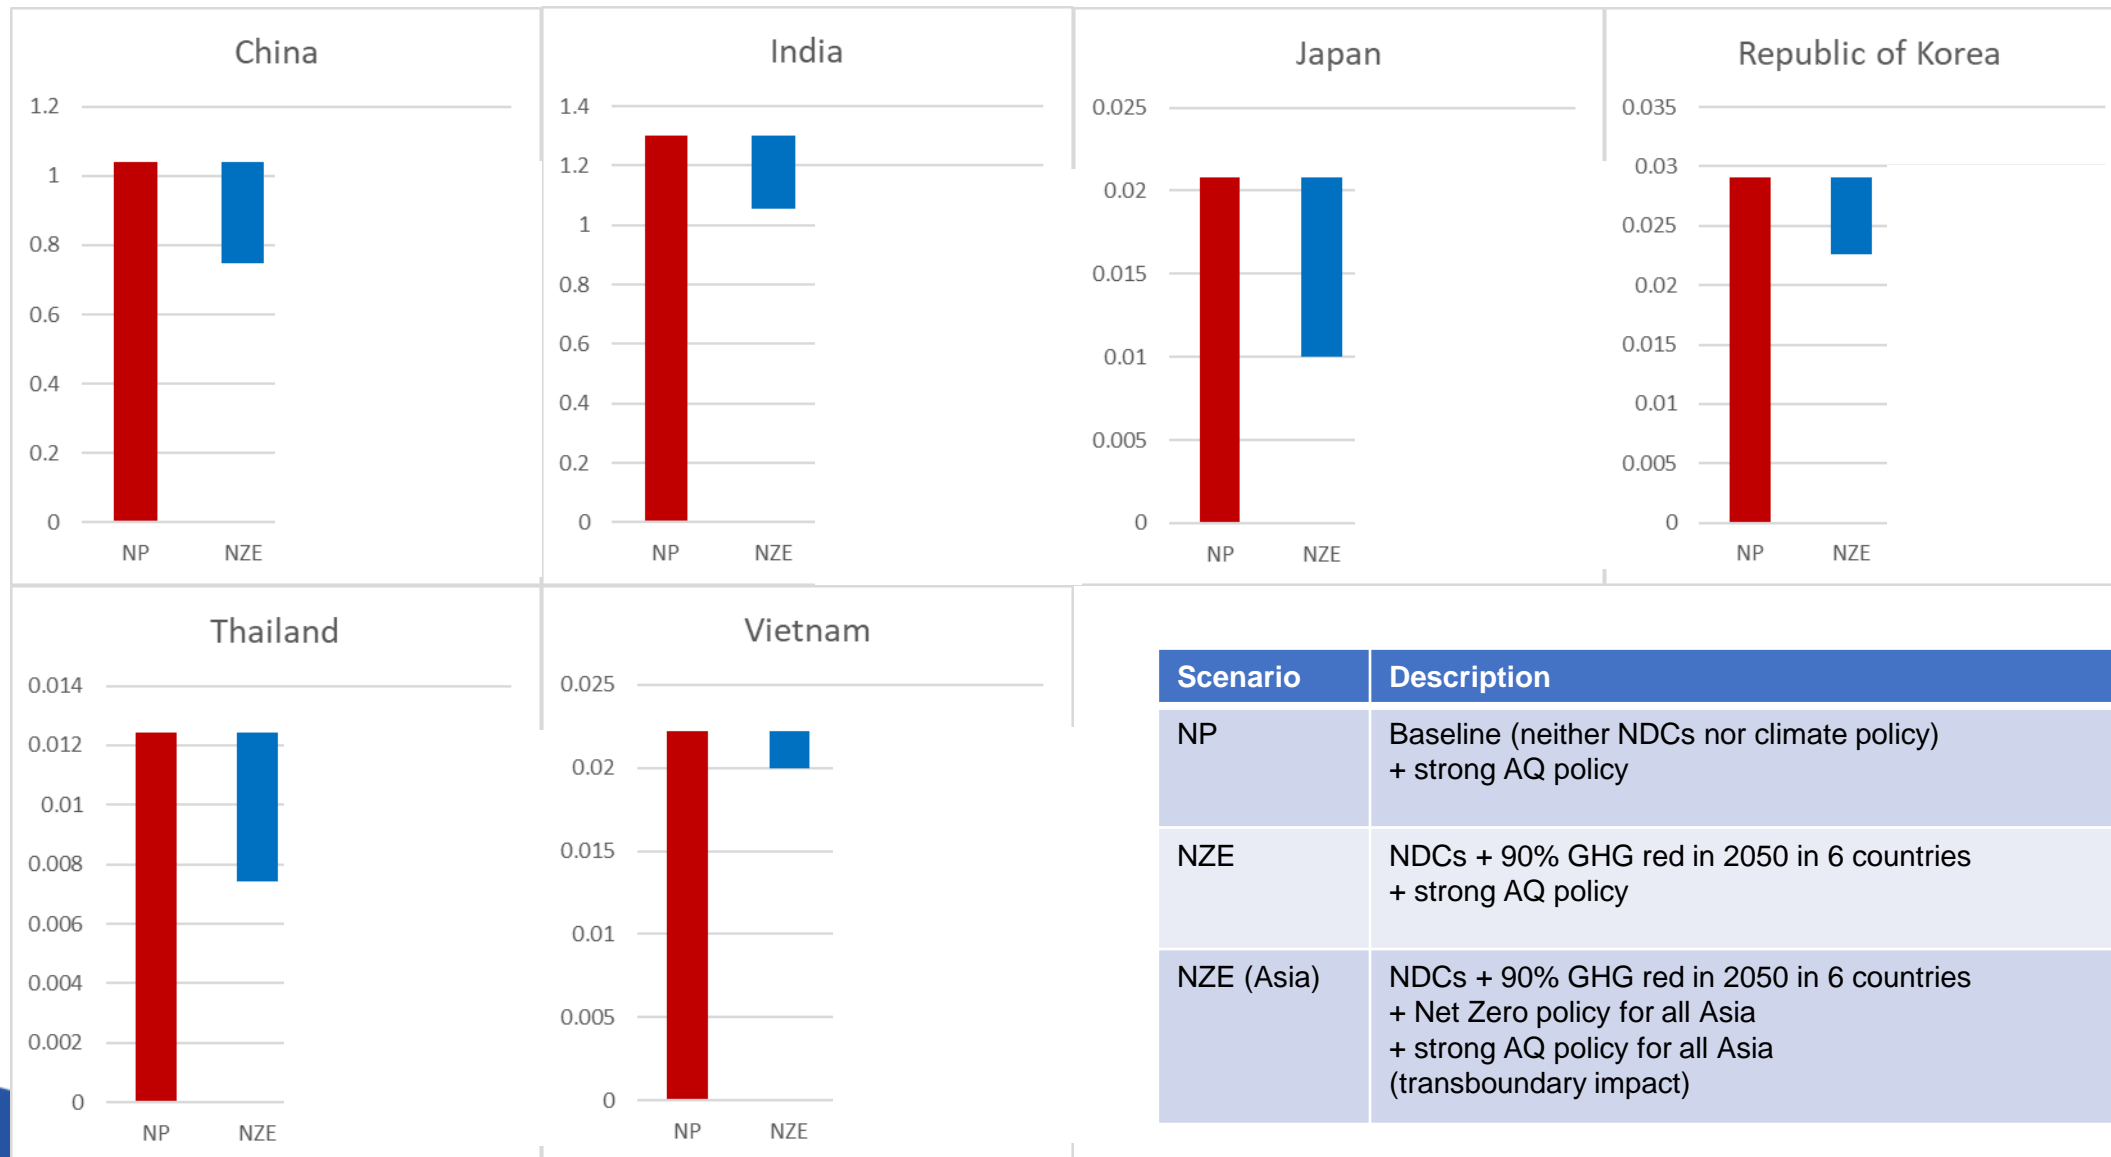

## *Change in population exposure*

Scenario	Description
NP	Baseline (neither NDCs nor climate policy) + strong AQ policy
NZE	NDCs + 90% GHG red in 2050 in 6 countries + strong AQ policy
NZE (Asia)	NDCs + 90% GHG red in 2050 in 6 countries + Net Zero policy for all Asia + strong AQ policy for all Asia (transboundary impact)

# Illustrative results:

*Change in premature mortality due to ambient PM<sub>2.5</sub> in 2050 (million people)*

Scenario	Description
NP	Baseline (neither NDCs nor climate policy) + strong AQ policy
NZE	NDCs + 90% GHG red in 2050 in 6 countries + strong AQ policy
NZE (Asia)	NDCs + 90% GHG red in 2050 in 6 countries + Net Zero policy for all Asia + strong AQ policy for all Asia (transboundary impact)

# Summary

## PM2.5 EXPOSURE

- Currently, only about 100 million people enjoy clean air\* in the 6 countries (China, India, Japan, Korea, Thailand, Vietnam)
- Strong air quality policy could increase that number by over 300 million by 2050
- Ambitious climate policies and further development measures would add another 1200 million, of which about 300 million if such policies were taken across all Asia

## PREMATURE DEATHS DUE TO AMBIENT PM2.5

- Strong climate policy in 6 countries prevents some 0.56 million premature deaths in 2050 in these countries
- If all Asia took up similar policy (netzero climate policy and strict air quality) additional 0.26 million could be prevented

\* Refers to the 2021 WHO air quality guideline value for PM2.5 of 5 ug/m<sup>3</sup>

# Work in Progress

- Bhutan Case Study
- Asia Vulnerability Hotspots Explorer
- Climate Biodiversity Assessment

# Sustainable energy-food-water and health nexus solutions enhancing regional community-based supply chain systems post-Covid-19 in **Bhutan**

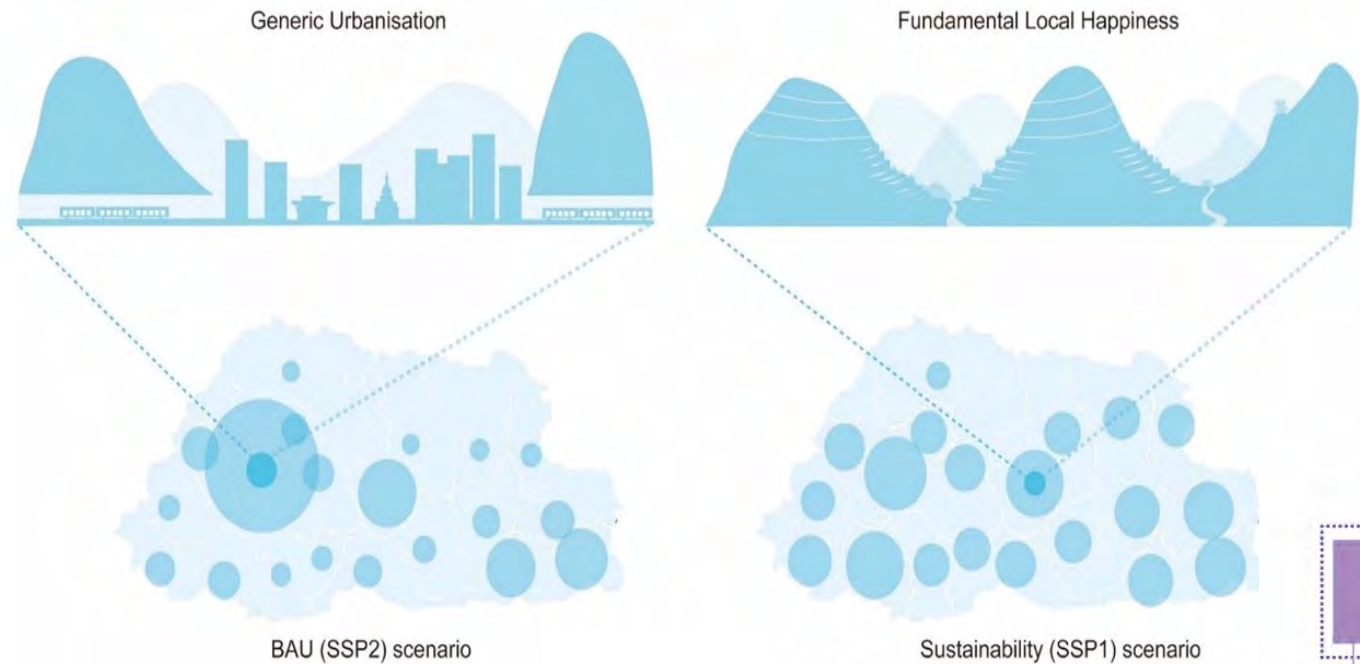

MOEJ – IIASA project B : Bhutan component

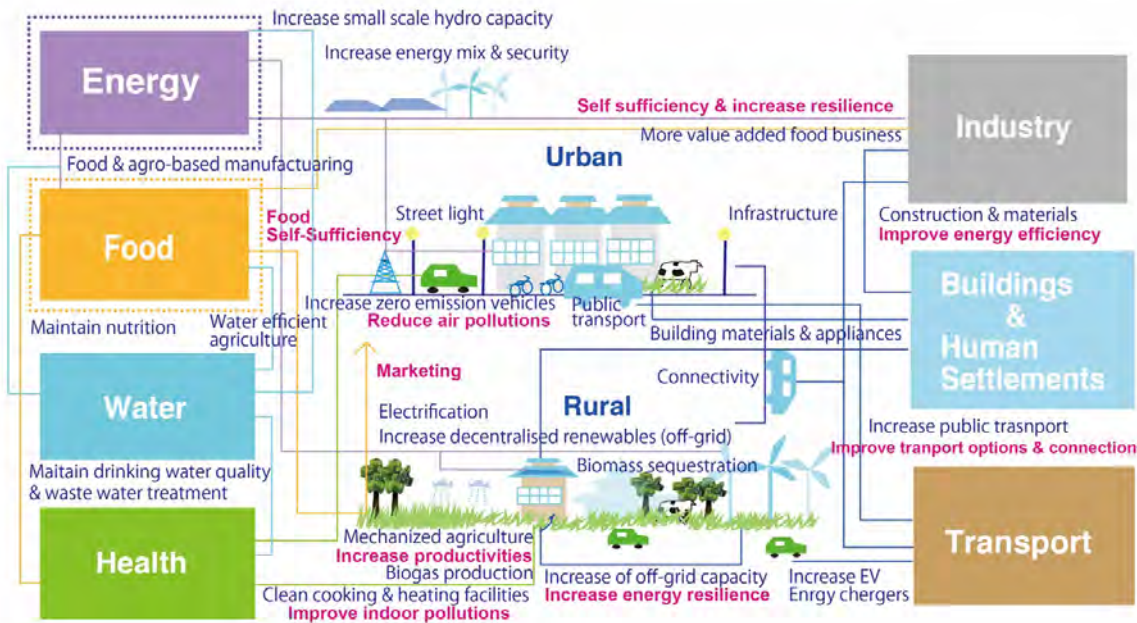

Miho Kamei (IGES), Tashi Wangmo (Bhutan), Louise Guibrunet (UNAM), Behnam Zakeri (IIASA), Peter Rafaj (IIASA), Shonali Pachauri (IIASA), Zbigniew Klimont (IIASA), Shuzo Nishioka (IGES), Mikiko Kainuma (IGES), Volker Krey (IIASA), Keywan Riahi (IIASA)

# Bhutan Case Study on post-covid energy-food-water and health nexus

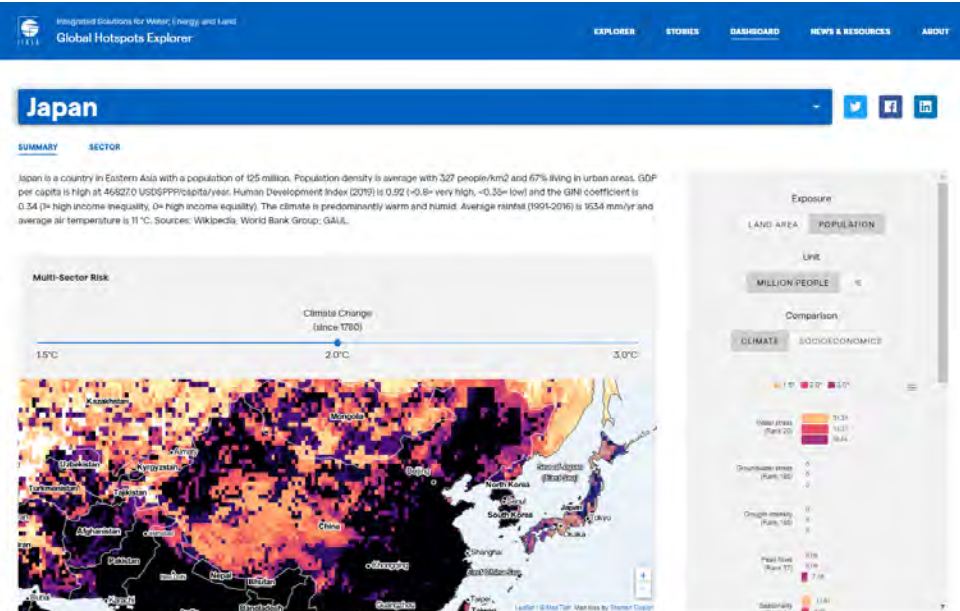

Covid-19

## Key sectors for mitigation

# Country-level dashboards

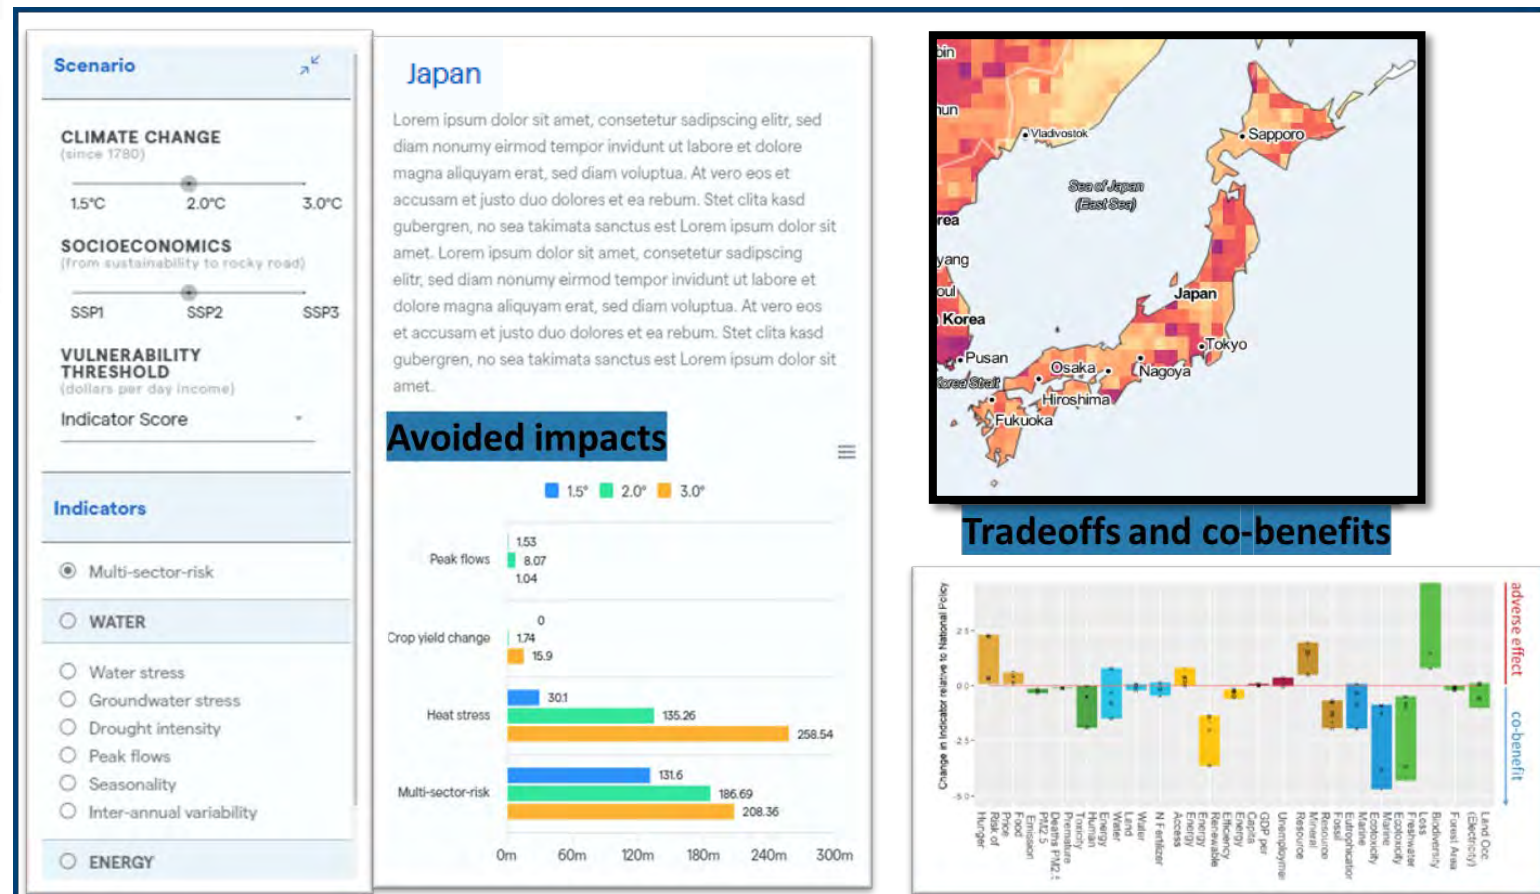

Key Risks for the Japan:

## Population exposure to

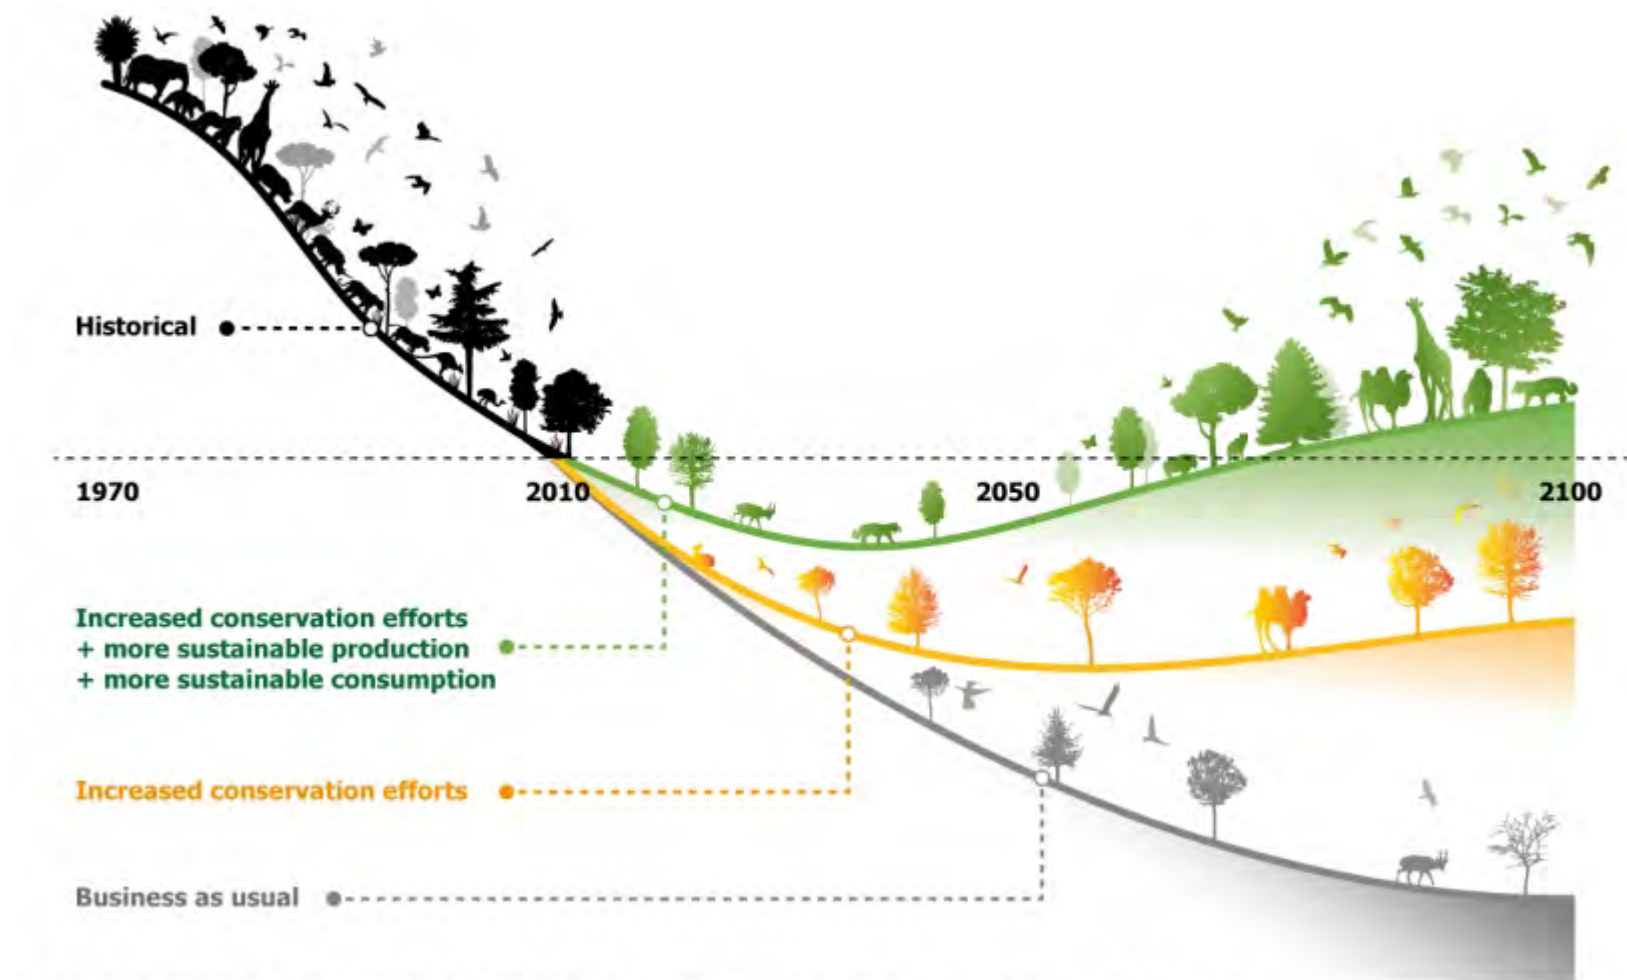

- Heatwaves
- Droughts
- Water stress
- Peak flows
- Crop yields
- Biodiversity

Vulnerable populations

# Hand-shake research between ecosystem modeling and integrated assessment models

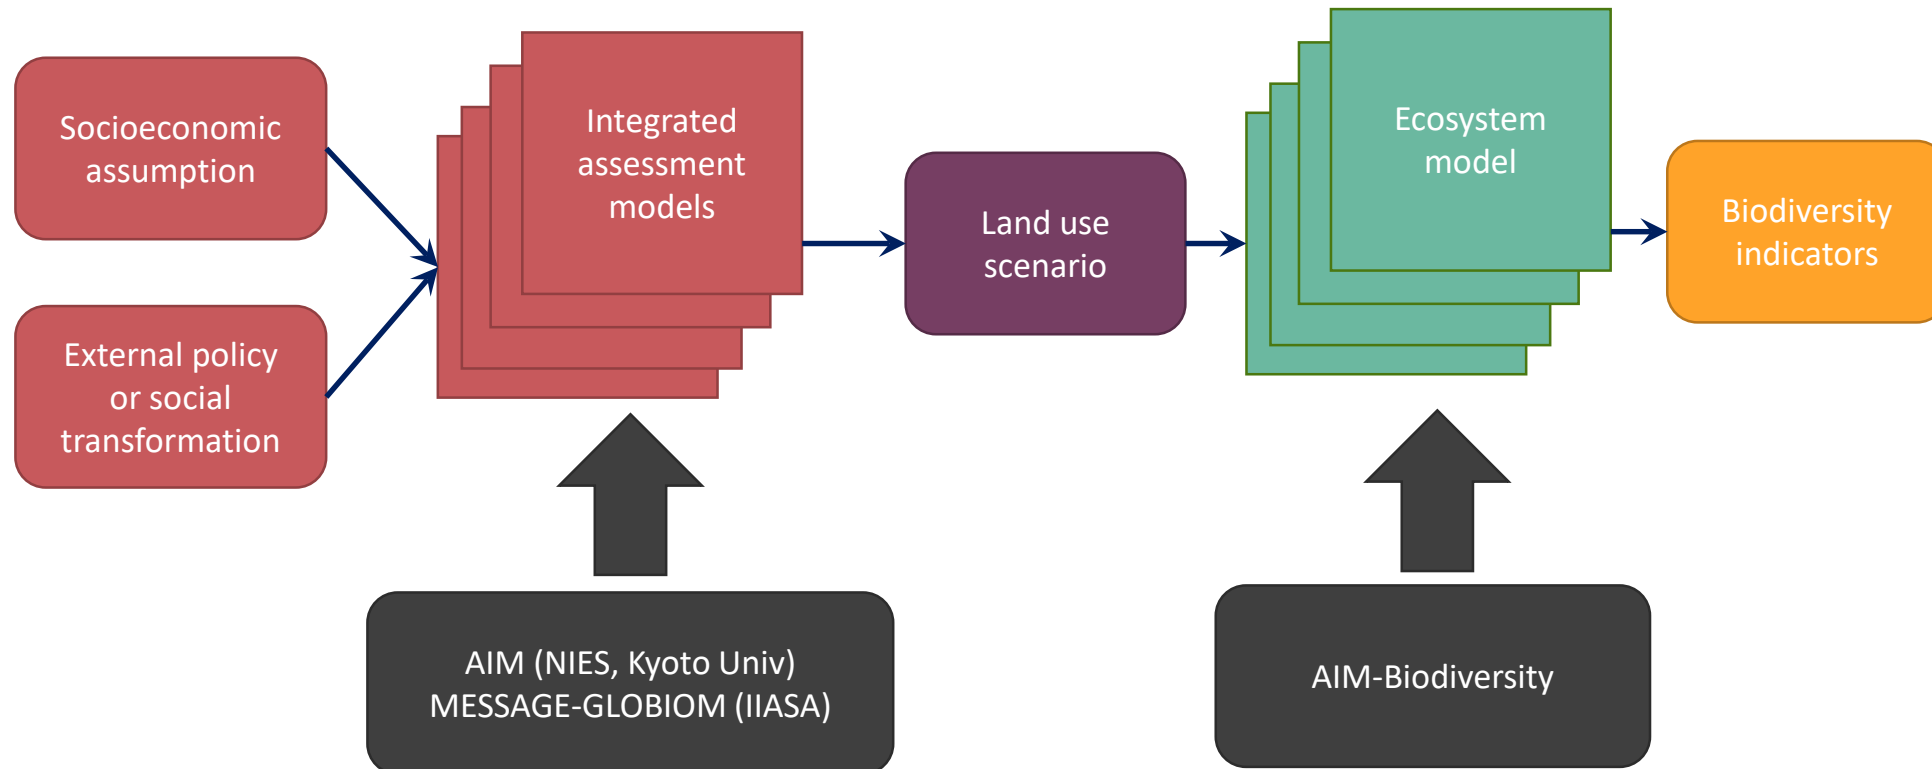

This artwork illustrates the main findings of the article, but does not intend to accurately represent its results (<https://doi.org/10.1038/s41586-020-2705-y>)

Milestone in  
biodiversity  
research with IIASA  
and NIES in leading  
roles

Link to Climate  
Policy remains  
underexplored

# Research framework for Asia

## Linking IIASA and NIES/Kyoto University models

# Considerations

---

- Scenario framework
  - ✓ Explore implications/risks of climate policy for biodiversity
  - ✓ Identify climate policy measures with biodiversity co-benefits
  - ✓ How much other societal transformations needed (e.g. dietary change and CH<sub>4</sub>)?
- Model approach
  - ✓ Economic assessment of climate options <-> biodiversity assessment
  - ✓ Tools: AIM-diversity, AIM CGE and MESSAGE-Globiom

# Proposed timeline – Project B

## Air pollution

- Review of assumptions about air quality policy and completion of simulations for additional scenarios and all countries – April 2022
- A policy report summarizing the results about air quality and health co-benefits in a clear language – June 2022
- Contribution to outreach activities – from the Summer 2022

## Biodiversity

- Start of work now - February 2022
- Coupling methods and testing completed – February 2023
- Policy Report – fourth quarter 2023

## Dashboard

- Preliminary assessment completed – February 2023
- Policy Report – fourth quarter 2023

## Outreach

- SBSTA or COP (Japan pavilion)

Thank you!
